

Figure 4-20b. Overlaid rod-tip pathways, including counterflex and rebound, along with subsequent loop shapes in two consecutive short-line casts. (N) Slightly convex pathway of the rod tip during a normally accelerated cast, resulting in a clean loop (1). (T) Deeply concave pathway of the rod tip during a cast where the rod is jerked forward, resulting in a tailing loop (2). Note that the tailing line must climb significantly upwards in order to unroll. Sequences from the video, *The Fifteen Most Common Casting Errors*.
